

Akorede Olasunkanmi (Koreh)

Backend Engineer | APIs • Distributed Systems • Blockchain Integration

Email: codekoreh@gmail.com

Portfolio: <https://codekoreh-github-io.vercel.app/>

GitHub: <https://github.com/codekoreh>

Professional Summary

Backend engineer focused on building scalable, production-ready systems with strong emphasis on performance, data integrity, and real-world reliability. Experienced in designing APIs, handling asynchronous workflows, and integrating blockchain systems with off-chain services.

Technical Skills

Node.js • TypeScript • PostgreSQL • Redis • Docker • REST APIs • WebSockets • Event-driven Architecture • Ethereum • ethers.js • Solidity • Git • AWS (basics)

Projects

Transaction Processing API

Designed a backend system to handle user transactions with focus on consistency and reliability under concurrent requests. Implemented transactional database operations and structured service layers for maintainability.

Blockchain Event Indexer

Built a service to listen to Ethereum smart contract events and store them in a structured database. Implemented event handling and retry logic to ensure reliable data synchronization between on-chain and off-chain systems.

Background Job Processing System

Developed a scalable job queue system using Redis and worker processes to handle asynchronous tasks such as email processing and data jobs. Focused on fault tolerance and scalability.

Education

BSc Biochemistry — 2014

Transitioned into Backend Engineering and Blockchain Development

Currently studying International Business Management — Siam Technology College, Bangkok, Thailand
